Note. The unit of observation is the country-year. Armed conflict is defined as 25 or more battle-related deaths in a country-year and is lagged by one year, so the analytic sample runs from 2001 to 2019 and each country contributes up to 19 observations. Countries move between the two columns as their conflict status changes, so the columns are not mutually exclusive groups of countries. Missing is reported for every variable because the denominator differs by row; maternal mortality in particular is unavailable for 2018 and 2019, which is why it is missing for about 12 percent of country-years. Covariates are reported in the units of the supplied covariates file.
